

What is RSS feeds and why are they everywhere

The history of RSS feeds is traceable long back to 1995 when Meta Content Framework was developed by Ramanthan V. Guha. These days the growth has been so quick in this technology that RSS feeds are used in peer to peer sharing like torrents.

RSS which is an abbreviation for rich site summary, and is jokingly referred to as really simple syndication sometimes and actually is a family of web feed formats. They are commonly and easily used to print regularly updated works like regular changes in blogs, news headlines, audio, and video in a standardized format. RSS document is called RSS feeds which contains highlights of information and is coupled with a link or metadata usually to give a brief of the information that can be accessed with its help. So it is nothing but a technique for highlighting news and other like material which are updated from the portals which give access to data embedded in the detailed map of websites.

Though RSS feeds were started with the limited application of maintaining news website they were soon adopted in the advertisement world, highlights of reports, articles and imported links. It is basically a mini database which is a agglomerate of headlines and catchphrases of the updated portions of the website.

The impressive characteristic of the software is that the program recognizes any change, alteration, addition or up gradation of a webpage or article in RSS format and respond to the change in the desired manner by automatically generating highlighted bulletin. This way the entire community of websites can keep each other updated with the changes happening in their websites and hence the result of one shows in all the related sites connected through the technology of RSS feeds. The obvious advantage is that the efforts of one page owner are honored by all and his data is accessible to the user of internet through any channel. Hence the result is that the performance of all the websites improves. The RSS reader, aggregator or feed reader is the name of the software used to read the change in the information by way of editing, uploading etc and communicating the same to the user.

Depending upon the nature of ones needs one may choose from amongst various available RSS feeds readers like Amphetadesk, FeedReader, and NewsGato The world of internet can not be imagined without this service anymore where the user effortlessly is provided with the information he requires. This is nothing but an information accessing and sharing technique. With the speed with which journalism is operating today, they have been a pace matcher in true sense to continue the vigor in furthering information to end users.

Clearly this has helped large number of users of the internet who are always in search of information of relevance to them. They owe a lot to RSS feeds technology and save large amounts of time and resources by this. So clearly we see that the future of this impressive technique is bright and promising.
